

ABSTRACT OF THE DISCLOSURE

A method for providing information, a
mobile communication system and a communication
5 apparatus are provided with high reliability of
providing information to mobile terminals. The
router transfers the information packets obtained
from the Internet to all of the access points. Each
of the access points transmits those information
10 packets to a service area of its own provided by the
access point. Therefore, the mobile terminal
located in the service area provided by any of the
access points can receive the information packets,
thereby the reliability of providing information to
15 the mobile terminals is improved.
